

hcl

```hcl
csvdecode(file("employees.csv"))
```

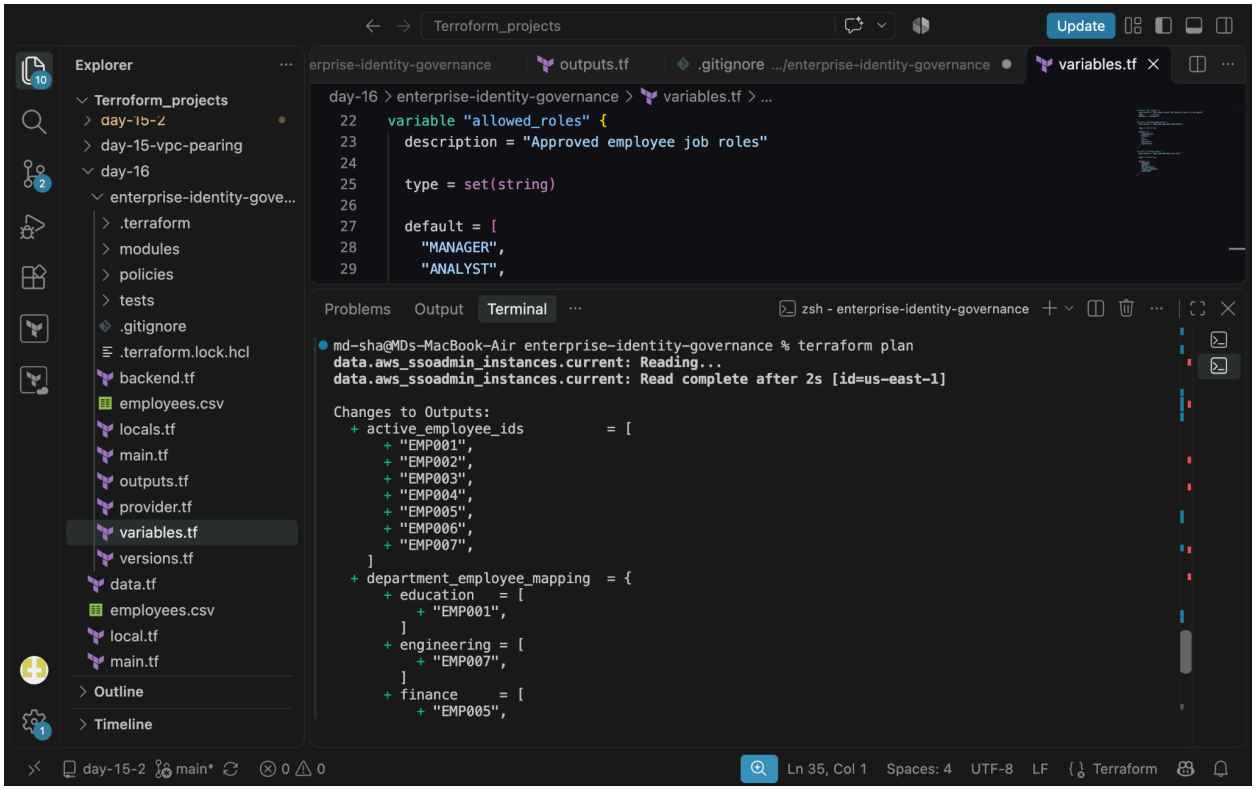

Two functions are working together:

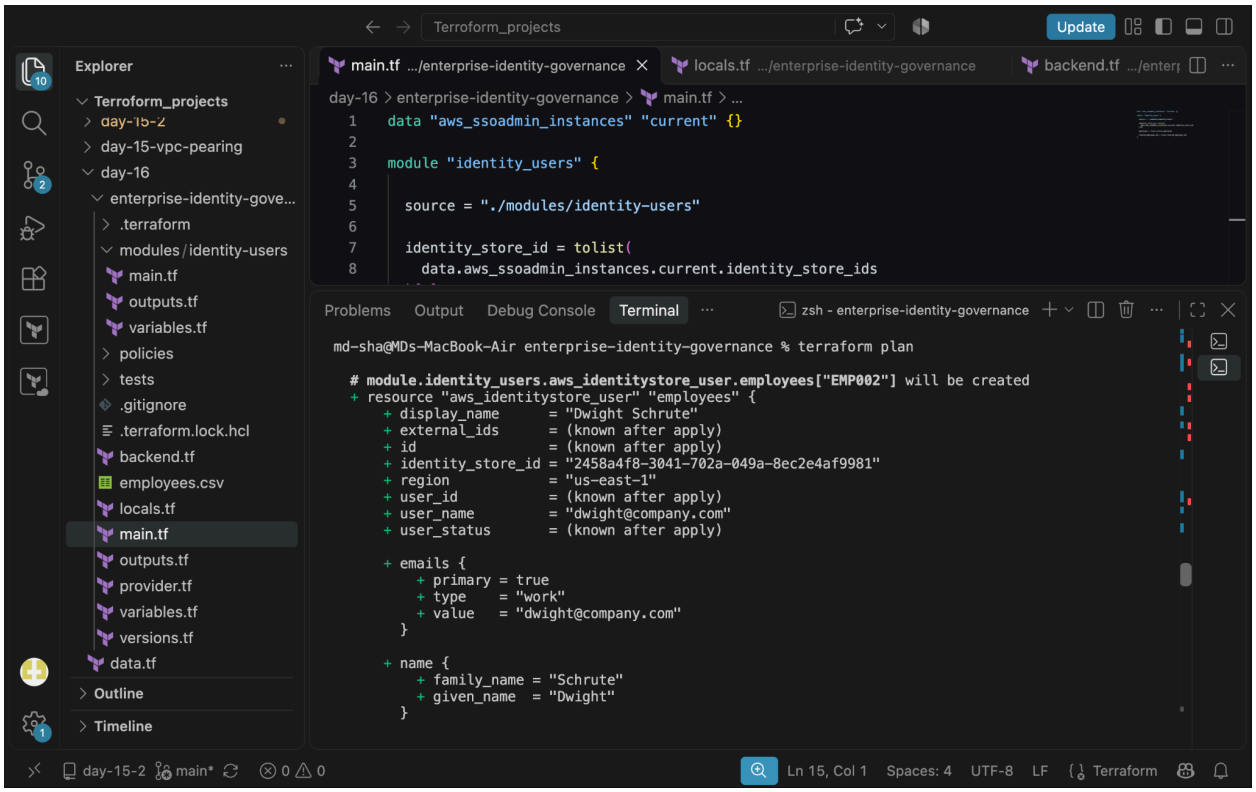

- `file()` reads the CSV file.
- `csvdecode()` converts the CSV contents into a list of maps.

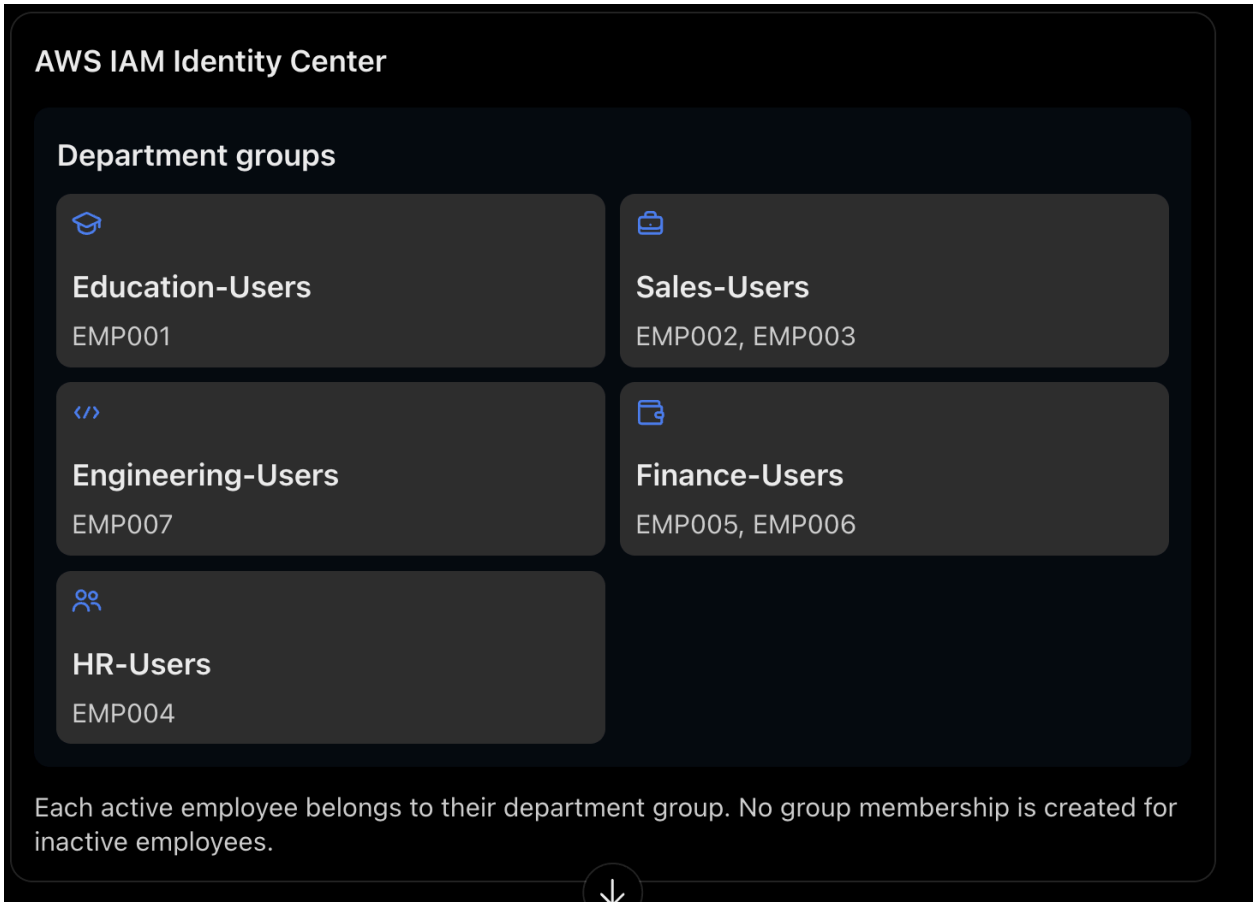

Conceptually, Terraform converts the CSV into something like:

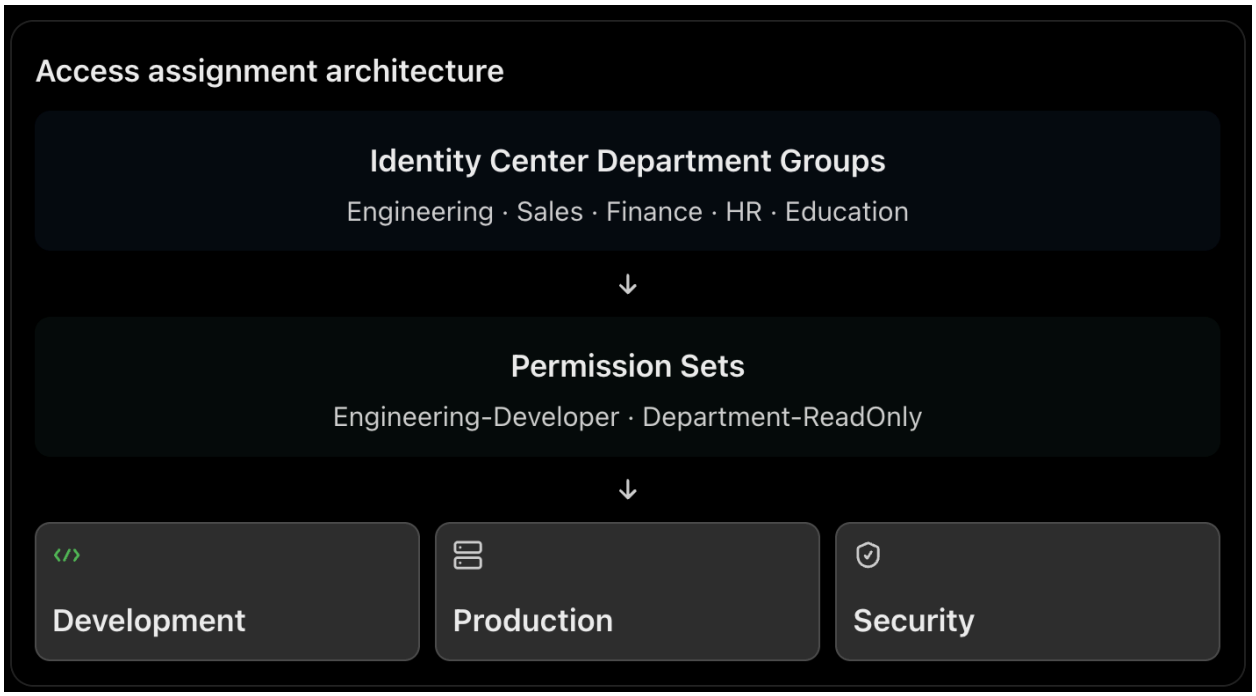

hcl

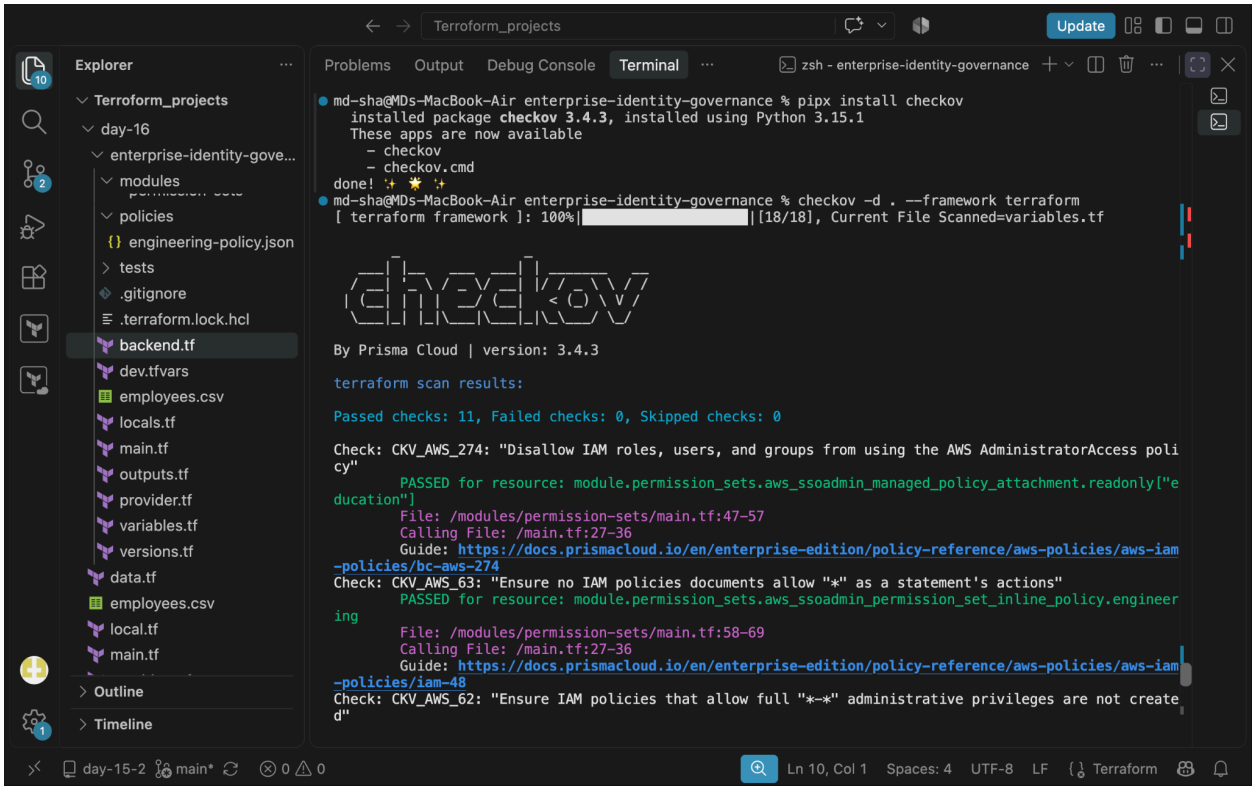

```hcl
[
  {
    employee_id      = "EMP001"
    first_name       = "Michael"
    last_name        = "Scott"
    department       = "Education"
    role             = "MANAGER"
    employment_status = "ACTIVE"
  },
  {
    employee_id      = "EMP002"
    first_name       = "Dwight"
    last_name        = "Schrute"
    department       = "Sales"
    role             = "ANALYST"
    employment_status = "ACTIVE"
  }
]
```

md-sha@MDs-MacBook-Air enterprise-identity-governance % brew install terraform-linters/tap/tflint
Warning: Calling `postflight` is deprecated! Use `postflight_steps` instead.
Please report this issue to the terraform-linters/homebrew-tap tap (not Homebrew/* repositories), or even better, submit a PR to fix it:
/opt/homebrew/Library/Taps/terraform-linters/homebrew-tap/Casks/tflint.rb:35
==> Trusted cask terraform-linters/tap/tflint
Warning: The following taps are not trusted:
owasp-amass/amass
wpscanteam/tap
Homebrew is currently ignoring formulae, casks and commands
from these taps because tap trust is required.
Prefer trusting only the specific formulae, casks or commands you need.
Trust installed formulae from these taps with:
brew trust --formula wpscanteam/tap/wpscan
Trust other specific casks and commands with:
brew trust --cask <user>/<tap>/<cask>
brew trust --command <user>/<tap>/<command>
Whole-tap trust is broader and includes all current and future formulae,
casks and commands from the listed taps. Trust whole taps with:
brew trust owasp-amass/amass wpscanteam/tap
Untap them with:
brew untap owasp-amass/amass wpscanteam/tap
For more information, see:
https://docs.brew.sh/Tap-Trust
